north shore of the St Lawrence River. That same year, while in the lower St Lawrence River region, he took some photographs of the construction of the Intercolonial Railway. This undertaking led in 1875 to a commission from the railway to record the principal structures along the almost-completed line connecting Montreal to Halifax. Commissions from other railways led to photographs of the construction of the Quebec, Montreal, Ottawa and Occidental Railway and the Canadian Pacific Railway (CPR) as far as Rogers Pass. Henderson also took photographs of the mountains and the progress of the construction of the railway.

In 1892 Henderson accepted a full-time position with the railway, which he was to set up and administer. His duties included recording the progress of the construction of the railway. That summer he made his second trip west, photographing the construction of the railway. He continued in this post until 1897, when he was promoted to the position of general manager. When Henderson died in 1913, his huge collection of photographs was sold to the Canadian Museum of History.

took photos of the progress of the construction of the railway

- people bought Henderson's photos because photography took up considerable time and the equipment was heavy
- the photographs Henderson sold were gifts

But a lot of ocean debris is 'microplastic', or pieces smaller than five millimeters. These may be ingredients used in cosmetics and toiletries, fibers shed by synthetic clothing, or fragments of plastic bottles and other debris. Compared to the number of studies investigating the effects of these tiny bits, 'There are very few studies on the effects of these tiny bits,' Rochman says, though she notes that more papers cite a 100-microgram cutoff point for the group's analysis.

There are also, she adds, a lot of open questions about the impact of plastic pollution on marine life. Many studies have looked at how plastic affects individual organisms rather than whole populations³. And in the lab, scientists have found that plastic can be toxic to what's really in the ocean⁴. None of that tells us how plastic pollution – or how deaths in one species could affect the rest of the ecosystem.

'We need to be asking more ecologically relevant questions about exactly how disasters such as a tanker accidentally spilling oil into the ocean will affect the environment until after the event,' she says. But if ecologists can understand the damage early enough, she says. But if ecologists can understand the damage to damaging ecosystems, they might be able to prevent them.

line. And she experimented with how ants react to live prey: a tethered fruit fly. Giraldo expected the older ants to perform poorly in all these tasks. But the elderly insects were all good caretakers and trail-followers – the 95-day-old ants could track the scent even longer than their younger counterparts. They all responded do light well, and the older ants were more active. And when it came to reacting to prey, the older ants attacked the poor fruit fly just as aggressively or pulling at the fly's legs.

Then Giraldo compared the brains of 20-day-old and to death. She saw no major differences with age, no cells^[6], showing that age didn't seem to affect special structures in their brains called mushroom bodies, which learning and memory. She also wanted to see if aging these structures – regions where neurons come together old ants didn't experience any drop in the levels of chemicals decline often coincides with aging^[8]. In humans, for Alzheimer's disease.

Part 1 Practice Skimming (1x)

Read the text and answer questions 1-4

The nutmeg tree, *Myristica fragrans*, is a large evergreen tree. In the 16th century, it only grew in one place in the world: a small island in the Moluccas – or Spice Islands – in northeastern Indonesia. It has tough, dark green oval leaves¹, and produces small, round, heart-shaped fruits. The fruit is encased in a fleshy husk. Within the husk, along a ridge running the length of the fruit². Inside the husk is a 1 cm across, surrounded by a lacy red or crimson covering. The two spices nutmeg and mace⁴, the former being produced from the seed.

Nutmeg was a highly prized and costly ingredient in medieval cooking, as a flavouring, medicinal, and preservative agent. Through the centuries, it was imported to Europe. They sold nutmeg to the Europeans, never revealed the exact location of the source of the spice. The dominance of the trade finally ended in 1512, when the Dutch began exploiting its precious resources.

Always in danger of competition from neighbouring Spain, the Portuguese began subcontracting their spice distribution to Dutch traders. Profits began to flow into the Netherlands, and the Dutch commercial fleet swiftly grew into one of the largest in the world. The Dutch quietly gained control of most of the

Case Study: Tourism New Zealand website

New Zealand is a small country of four million inhabitants, generating markets of the world. Tourism currently accounts for 20% of the country's GDP and is the country's largest export sector. Unlike other countries, tourism brings its customers to New Zealand rather than overseas, tourism brings its customers to New Zealand. The places and the experiences. In 1999, Tourism New Zealand launched a brand position to the world. The campaign focused on promoting outdoor activities and authentic Maori culture, and it made New Zealand a world.

A key feature of the campaign was the website newzealand.com, which provided a single gateway to everything the destination had to offer. A database of tourism services operators, both those who were already offering tourism service to the country. Any tourism operator had to offer a form. This meant that even the smallest bed and breakfast had a web presence with access to an audience of long-haul tourists. Businesses were able to update the details they gave

And to maintain and improve standards, Tourism New Zealand organised a scheme

Henry Moore (1898-1986)

The British sculptor Henry Moore was a leading figure in the 20th century.

Henry Moore was born in Castleford, a small town near Leeds. He was the youngest of four children of Raymond Moore and his wife Mary Baker. He studied at Castleford Grammar School, where his interest in art was encouraged by his teacher Alice Gostick. However, his father wanted him to become an engineer, so instead he complied with his father's wish that he train as an apprentice engineer when he was sent to France to fight in the First World War.

After the war, Moore enrolled at the Leeds School of Art, where he spent most of his time drawing. At the end of that year, he passed the sculpture examination and was awarded a scholarship to study in London. In September 1921, he moved to London and began his studies at the Royal College of Art.

Alongside the instruction he received at the Royal College, Moore also visited the British Museum, which had a wide-ranging collection of ancient Egyptian and African sculpture. He was particularly impressed by the and beauty of ancient Egyptian and African sculpture. After graduating, Moore spent the first six months of 1925 in Paris, where he was impressed by a cast of a Mayan sculpture.

After returning to Leeds, Moore spent the next few years working as a sculptor. He was particularly impressed by a cast of a Mayan sculpture in Paris, which he saw at the Leeds School of Art. He himself started carving a stone sculpture, which he thought had a power and originality that no other stone sculpture possessed.

Roman tunnels

The Romans, who once controlled areas of the world, used the techniques of other civilizations to build tunnels.

The Persians, who lived in present-day Iran, used a technique to supply of water to human settlements in the desert. They dug a route of tunnel construction, which consisted of digging a horizontal route, and then digging vertical shafts down into the earth from between the ends of the shafts. The shafts, which also provided ventilation during construction, were dug from the top of a hillside down towards a valley. The tunnels by the Persians 2,700 years ago are still in use today.

They later passed on their knowledge to the Romans, who used tunnels for agriculture. Roman *qanat* tunnels were built up to 60 meters deep. The shafts were equipped with wooden or stone lids. The shafts were covered with a wooden or stone lid. The shafts were placed across the top of each shaft and made of wood or stone. Plumb lines were also used to measure the depth of the shafts. The kilometer Long Claudius tunnel, built in 41 AD, was 11 kilometers deep, took 11 years to build and involved approximately 30,000 workers.

Materials to take us beyond concrete

Concrete is everywhere, but it's bad for the planet, generating greenhouse gas emissions. As the world's population grows, more cities will be developed.

A

Concrete is the second most used substance in the global economy. It is one of the main sources of greenhouse gas emissions. The chemical process of making concrete results in large quantities of carbon dioxide. The UN estimates that by mid-century, they will need somewhere to live. If concrete continues to be used, carbon emissions will soar, aggravating global warming. Architects are in a scramble for alternatives to a universal commodity that has become a problem.

B

The problem with replacing concrete is that it is so very good. Professor at Imperial College London, says the key thing to consider is not just the world, and is likely to continue to be used. 'Concrete is not just a material, it is a way of life. But it is the scale on which it is used that makes it high on the list of issues.'

C

Many are the ingredients of concrete relatively cheap and found in abundance in most places around the globe.

Frozen Food

A US perspective on the development of the frozen food industry

At some point in history, humans discovered that ice preserved food in the summer as far back as 10,000 years ago. In America's Andean mountains had a unique means of conserving food: they would freeze food overnight, then trampled them to squeeze out the moisture, and then they would dry the value - if not their aesthetic appeal^[1].

Natural ice remained the main form of refrigeration until late in the 19th century. In Boston, USA, had enormous blocks of Arctic ice towed all over the world. In 1851, railroads first began putting blocks of ice in insulated boxes. In Boston^[2].

Finally, in 1870, Australian inventors found a way to make 'artificial ice' using ammonia at first and later Freon-through a condenser. The gas was released quickly through the condenser. Then the gas was released quickly and cold. Air was blown over the evaporator coil and then the temperature was lowering its temperature to freezing point.

Initially, this process was invented to keep Australian beer cold.

It was not until 1880 that they quickly realized that, if they could put this new invention on a ship, they could export meat across the oceans. In 1880, a shipment of Australian beef and mutton was sent frozen to England^[3]. While the food frozen this way was still

To biomedical researchers all over the world, twins offer a precious opportunity to untangle the influence of genes and the environment – of nature and nurture. Because identical twins come from a single fertilized egg that splits into two, they share virtually the same genetic code. Any differences

example – must be due to environmental factors such as le

Alternatively, by comparing the experiences of identical tw
eggs and share on average half their DNA, researchers can
identical twins are more similar to each other with respect
the disease must be rooted at least in part in heredity[2].

Synthesis of an online debate*

A

Two things distinguish food production from all other production: first, it is a continuous process that takes place every day and has a right to it; and second, it is hugely dependent on other natural resources. These factors make food production highly vulnerable and its values are highly entrenched in food and agricultural systems.

B

Farmers everywhere face major risks, including extreme weather and product markets. However, smallholder farmers in developing environments, both natural, in terms of soil quality, rainfall, and technology. Counter-intuitive, systems, markets, knowledge and technology. Counter-intuitive, in the developing world.

C

Participants in the online debate argued that our biggest challenge is the agricultural system's inability to ensure sufficient food for growing dependency on fossil fuels and unsupportive government policies.

'Play in all its rich variety is one of the highest achievements of the human species,' says Dr David Whitebread from the Faculty of Education at the University of Cambridge, UK. 'It underpins how we develop as intellectual, problem-solving adults and is crucial to our success as a highly adaptable species.'

Recognizing the importance of play is not new: over two millennia ago, Aristotle saw play as a means of developing skills for adult life, and ideas about play have changed throughout the last century.

But we live in changing times, and Whitebread is mindful of the challenges facing children today. 'The opportunities for play in childhood, are becoming increasingly scarce,' he says. 'Outside play, such as playing in the street, has declined, as well as parents' increased wish to protect their children from risks. This is leading to a more pessimistic view on 'earlier is better' which is leading to greater emphasis on structured activities.'
